XRPX Acc No: N90-006758

**Tactile or kinaesthetic warning of inter-vehicular collision hazard -
uses vibration felt by driver when fuel supply is interrupted on
dangerously close approach**

Patent Assignee: BOSCH GMBH ROBERT (BOSC)

Inventor: GEISER G

Number of Countries: 005 Number of Patents: 004

DE 58907205	G			B60Q-001/52	Based on patent EP 348691
-------------	---	--	--	-------------	---------------------------

Abstract (Basic): EP 348691 A

Rangefinding devices at the front and/or rear of the vehicle are wired to a processor which extracts information for alerting the driver, e.g. to an instant when the distance from a preceding or following vehicle falls short of the min. safe spacing. The processor reacts on an electronic fuel injection system so as to interrupt the supply of fuel during one or more ignition cycles. This results in uneven running of the engine, or loss of power which is detectable by the driver as vibration of the steering column or driving seat.

ADVANTAGE - Does not improve a visual or aural overload on driver; nor does it depend upon contact between right foot and accelerator pedal.

0/2

Abstract (Equivalent): EP 348691 B

Method and device for haptic display of distance warning in a motor vehicle using distance sensors and an evaluating electronic system, which effects the distance warning by vibration of the steering wheel, the driver's seat or the entire passenger cell, characterised in that multi-stage distance warning information is transmitted through the stepped intensity of and/or temporal variation in vibration.
